

CHANNEL LETTERS

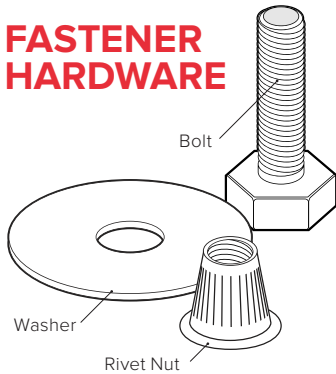

INSTALLATION

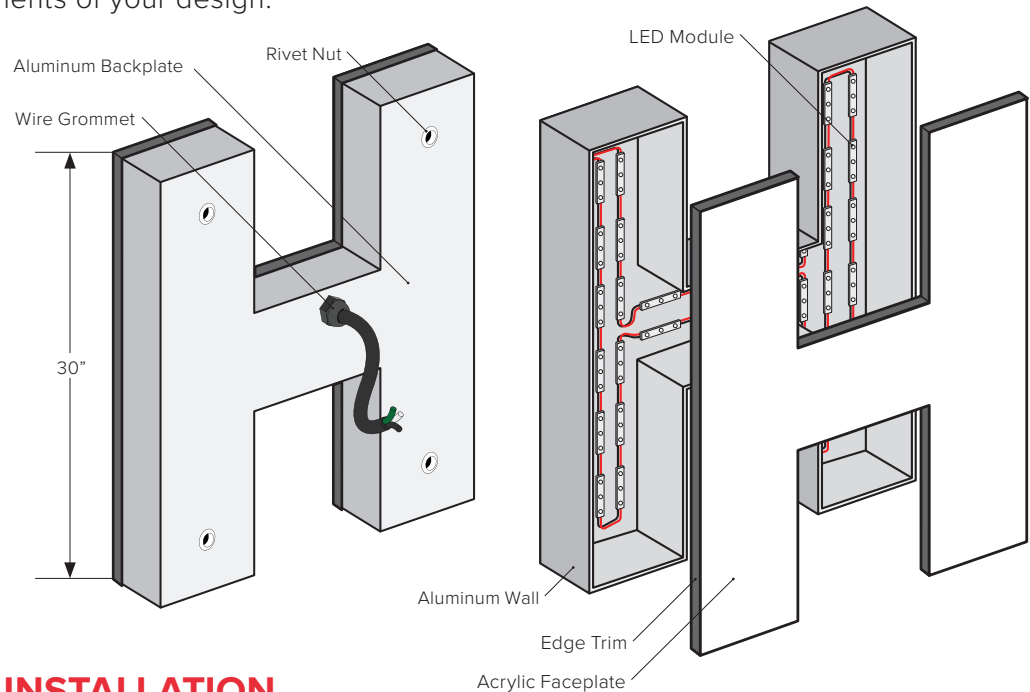

BASIC PARTS & ASSEMBLY

Light-box letters are constructed from a thick, aluminum backplate and custom bent walls that are stamped and adhered together to provide long lasting rigidity. High Output LED Modules in a variety of colors are used inside each letter. The available colors are white, blue, red, green, or amber to further enhance the faceplate color. The frosted acrylic face can be white or any CMYK printable color to match or highlight other elements of your design.

FASTENER HARDWARE

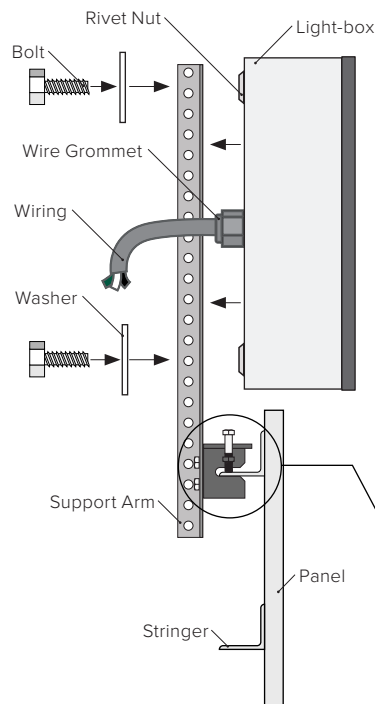

The versatile Rivet Nut hardware inset into the back of the light-boxes allows for multiple installation methods.

INSTALLATION

Hovering Installation

The prop can install directly to the face of the panel with washers and bolts or above the panel using Support Arms for structural support allowing for billboard vinyl copy changes without removing the light-boxes. Custom tailored installation instructions are sent with every order to match the artwork.

There is a power supply included in each letter making powering them up a simple process. After installation, hook the black, white, and green wires to the 120V/220V power source on the structure. **Additional wire may be needed to link the Wiring Harness to the Power Source.**
